AMENDMENTS TO THE SPECIFICATION:

Please replace the paragraph beginning at page 6, line 6, with the following rewritten paragraph:

-- The expected activity for a given combination of 2 or 3 active compounds can be calculated in accordance with S.R. Colby ("Calculating Synergistic and Antagonistic Responses of Herbicide Combinations", Weeds <u>1967</u>, <u>15</u>, 20-22) as follows:

If

- X denotes the efficacy when using active compound A at an application rate of m g/ha,
- Y denotes the efficacy when using active compound B at an application rate of \underline{n} g/ha,
- Z denotes the efficacy when using active compound C at an application rate of \underline{r} g/ha,
- E₁ denotes the efficacy when using active compounds A and B at application rates of \underline{m} and \underline{n} g/ha, and
- E₂ denotes the efficacy when using active compounds A and B and C at application rates of \underline{m} and \underline{r} g/ha,

then

$$E_1 = X + Y - \frac{X \cdot Y}{100}$$

and for a combination of 3 active compounds:

$$\left[\left[E_2 = X + Y + Z - \frac{X \cdot Y - X \cdot Z - Y \cdot Z}{100} + \frac{X \cdot Y \cdot Z}{10000} \right] \right]$$

$$E_2 = X + Y + Z - \frac{X \cdot Y + X \cdot Z + Y \cdot Z}{100} + \frac{X \cdot Y \cdot Z}{10000}$$

The efficacy here is determined in %. 0% denotes an efficacy which corresponds to that of the control, while an efficacy of 100% means that no infection is observed. –
